# 5. Der Integralsatz von Stokes

#### Definition

Sei  $\Phi = (\Phi_1, \Phi_2, \Phi_3)$  eine Fläche mit Parameterbereich  $B \subseteq \mathbb{R}^2, D \subseteq \mathbb{R}^2$  offen,  $B \subseteq D, \Phi \in C^1(D, \mathbb{R}^3)$ und  $S = \Phi(B)$ .

Für  $f: S \to \mathbb{R}$  stetig und  $F: S \to \mathbb{R}^3$  stetig:

$$\begin{cases} \int_{\Phi} f \, \mathrm{d}\sigma & := \int_{B} f \left( \Phi(u,v) \right) \cdot \parallel N(u,v) \parallel \mathrm{d}(u,v) \\ \int_{\Phi} F \cdot n \, \mathrm{d}\sigma & := \int_{B} F \left( \Phi(u,v) \right) \cdot N(u,v) \, \mathrm{d}(u,v) \end{cases} } \right\} \, \mathrm{Oberfl\"{a}chenintegrale}$$

#### Beispiele 5.1

- (1) Für  $f \equiv 1 : \int_{\Phi} 1 \, d\sigma =: \int_{\Phi} d\sigma = I(\Phi)$
- (2) Sei  $B := \{(u,v) \in \mathbb{R}^2 : u^2 + v^2 \le 1\}, \ \Phi(u,v) := (u,v,u^2 + v^2), \ F(x,y,z) = (x,y,z)$ Bekannt:  $N(u,v) = (-2u,-2v,1), \ F(\Phi(u,v)) = (u,v,u^2 + v^2) \Rightarrow \int_{\Phi} F \cdot n \ d\sigma = \int_{B} (u,v,u^2+v^2) \cdot (-2u,-2v,1) d(u,v) = -\int_{B} (u^2+v^2) d(u,v) \stackrel{u=r\cos\varphi,v=r\sin\varphi}{=} -\int_{0}^{2\pi} (\int_{0}^{1} r^3 dr) d\varphi = -\frac{\pi}{2}$

## Satz 5.2 (Integralsatz von Stokes)

 $B, D, \Phi$  seien wie oben. B sei zulässig,  $\partial B = \Gamma \gamma$ , wobei  $\gamma = (\gamma_1, \gamma_2)$  wie in §2. Es sei  $\Phi \in C^2(D, \mathbb{R}^3), G \subseteq \mathbb{R}^3$  sei offen,  $F \subseteq G$  und  $F = (F_1, F_2, F_3) \in C^1(G, \mathbb{R}^3)$ . Dann:

$$\underbrace{\int_{\Phi} \operatorname{rot} F \cdot n \, \mathrm{d}\sigma}_{\text{Oberflächenintegral}} = \underbrace{\int_{\Phi \circ \gamma} F(x,y,z) \, \mathrm{d}(x,y,z)}_{\text{Wegintegral}}$$

#### **Beweis**

Beweis
$$\varphi := \Phi \circ \gamma, \varphi = (\varphi_1, \varphi_2, \varphi_3), \text{ also: } \varphi_j = \Phi_j \circ \gamma \quad (j = 1, 2, 3)$$
Zu zeigen: 
$$\int_{\Phi} \operatorname{rot} F \cdot n \, d\sigma = \int_0^{2\pi} F(\varphi(t)) \cdot \varphi'(t) dt = \sum_{j=1}^3 \int_0^{2\pi} F_j(\varphi(t)) \cdot \varphi'_j(t) dt$$
Es ist 
$$\int_{\Phi} \operatorname{rot} F \cdot n \, d\sigma = \int_B \underbrace{(\operatorname{rot} F)(\Phi(x, y)) \cdot (\Phi_x(x, y) \times \Phi_y(x, y))}_{=:g(x, y)} d(x, y)$$

$$\begin{aligned} & \text{F\"{u}r } j = 1, 2, 3: g_j(x,y) := \underbrace{(F_j(\Phi(x,y)) \frac{\partial \Phi_j}{\partial y}(x,y), \underbrace{-F_j(\Phi(x,y)) \frac{\partial \Phi_j}{\partial x}(x,y)}_{=:v_j(x,y)}, \underbrace{-F_j(\Phi(x,y)) \frac{\partial \Phi_j}{\partial x}(x,y),}_{=:v_j(x,y)} \\ & F \in C^1, \Phi \in C^2 \Rightarrow g_j \in C^1(D, \mathbb{R}^2) \end{aligned}$$

$$F \in C^{1}, \Phi \in C^{2} \Rightarrow g_{j} \in C^{1}(D, \mathbb{R}^{2})$$
Nachrechnen:  $g = \text{div } g_{1} + \text{div } g_{2} + \text{div } g_{3} \Rightarrow \int_{\Phi} \text{rot } F \cdot n \, d\sigma = \sum_{j=1}^{3} \int_{B} \text{div } g_{j}(x, y) d(x, y)$ 

$$\int_{B} \text{div } g_{j}(x, y) d(x, y) \stackrel{2.1}{=} \int_{\gamma} (u_{j} dy - v_{j} dx) = \int_{0}^{2\pi} \left( u_{j} \left( \gamma \left( t \right) \right) \cdot \gamma'_{2}(t) - v_{j} \left( \gamma \left( t \right) \right) \cdot \gamma'_{1}(t) \right) \, dt = \int_{0}^{2\pi} (F_{j}(\varphi(t)) \frac{\partial \Phi_{j}}{\partial y} \gamma(t) \gamma'_{2}(t) + F_{j}(\varphi(t)) \frac{\partial \Phi_{j}}{\partial x} \gamma(t) \gamma'_{1}(t) dt = \int_{0}^{2\pi} F_{j}(\varphi(t)) \cdot \varphi'_{j}(t) dt \Rightarrow \int_{\Phi} \text{rot } F \cdot n d\sigma = \sum_{j=1}^{3} \int_{B} \text{div } g_{j}(x, y) d(x, y) = \sum_{j=1}^{3} \int_{0}^{2\pi} F_{j}(\varphi(t)) \cdot \varphi'_{j}(t) dt$$

## 5. Der Integralsatz von Stokes

### Beispiel

 $B, \Phi, F$  seien wie in Beispiel 4.1.(2).  $\gamma(t) = (\cos t, \sin t), t \in [0, 2\pi]$ . Verifiziere 4.2 Hier:  $\cot F = 0$ , also  $\int_{\Phi} \cot F \cdot n d\sigma = 0$ .  $(\Phi \circ \gamma)(t) = (\cos t, \sin t, 1) \Rightarrow \int_{\Phi \circ \gamma} F(x, y, z) d(x, y, z) = \int_{0}^{2\pi} (\cos t, \sin t, 1) \cdot (-\sin t, \cos t, 0) dt = 0$
